

Leverage SynCollaborate for Seamless Product Development and Better Manufacturer-Supplier Collaboration

Managing suppliers is a key function in the manufacturing lifecycle. It has become imperative for manufacturing companies to involve suppliers early in the development process for improved quality and reduced cost of product development. However, manufacturers face the following issues while collaborating with suppliers:

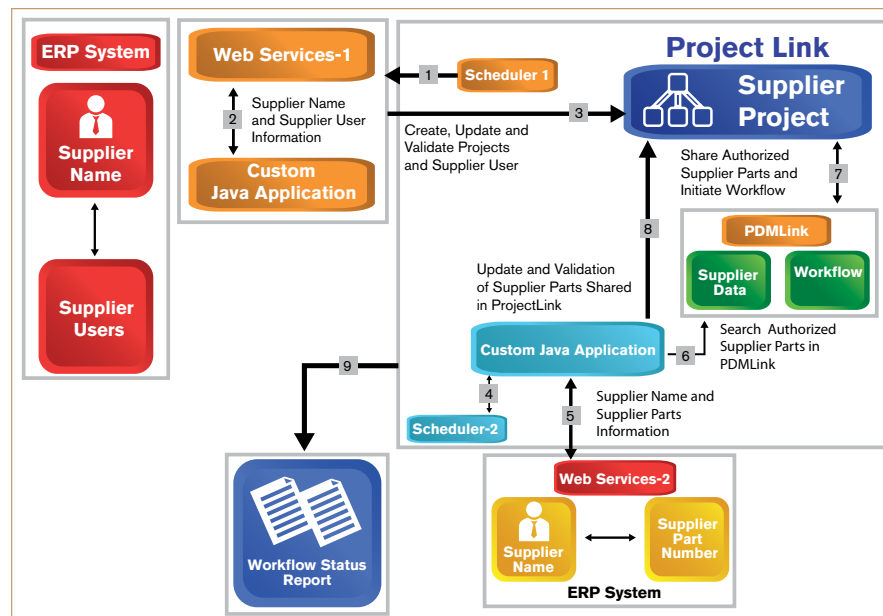

- Difficulty to adapt to the User Interface
- Sluggish communication between OEM's and suppliers
- Massive rework and quality issues
- Unsecure environment for data sharing
- Non-compliant data transfer mediums
- Risk for IP
- No integration with legacy and ERP applications to enable sharing of enterprise information

It is inevitable for manufacturers to share the product design with their suppliers but the supplier modules in off-the-shelf PLM tools incur a huge licensing cost. A good supplier collaboration tool should help optimize efficiency and effectiveness while keeping costs low and:

- Improve traceability, consistency, and control over the data shared with the suppliers
- Secure data sharing while adhering to compliances
- Ensure seamless communication for the faster turnaround

Syntel Solution

Syntel's years of experience working with global manufacturers led us to develop SynCollaborate, a utility that enables manufacturers to securely collaborate with suppliers and participate in the product development process.

How SynCollaborate sits in your PLM Environment
